Better cacao.
Measured process.
Shared learning.

CaAPs · Cacao Quality & Traceability

Zamboanga del Norte industry challenge | Presenter: CaAPs Team

Where does a harvest lose its value?

30–40%

downgraded beans reported on the challenge poster

- Inconsistent post-harvest handling
- Fermentation and drying are difficult to compare
- Quality decisions need a traceable record

Source: user-supplied industry challenge poster. Baseline not independently validated.

The process matters.
So does the evidence.

- ICCO explains the role of fermentation and controlled drying.
- DOST-PCAARRD identifies skills, grading and facility-access gaps.
- Design implication: combine records with tools, training and review.

Sources: ICCO, Harvesting & Post-harvest; DOST-PCAARRD, Cacao Industry Profile.

One batch. A history you can follow.

01
Harvest & allocate

02
Ferment & turn

03
Dry & measure

04
Assess & review

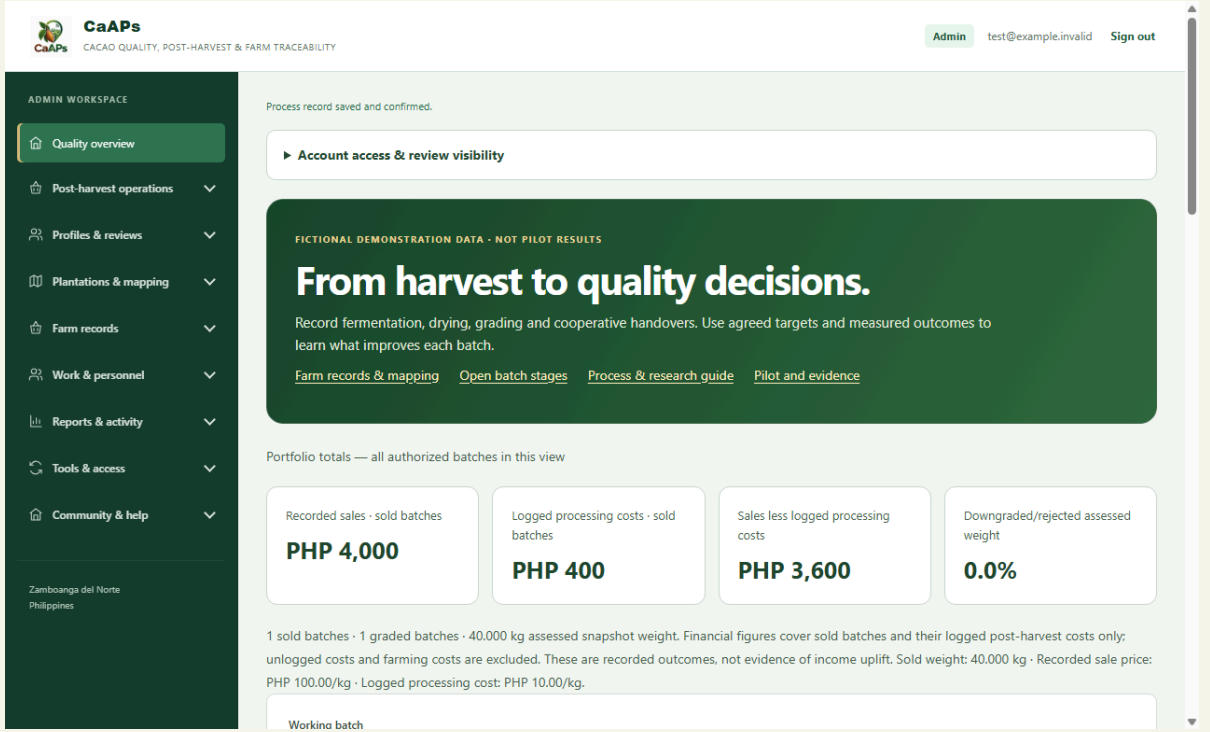

05
Store & hand over

06
Sell & learn

Farm provenance stays connected to the post-harvest record.

A workspace for observations and decisions.

- Buyer/adviser-agreed protocol
- Temperature, turning and moisture records
- Quality observations and staff-recorded grades
- Costs, handovers and correction history

Illustrative screen uses isolated fictional fixtures. No live farmer data.

40 sec

A pass label is not enough.

- Agreed protocol and actual fermentation start
- Cut-test sample, moisture and reviewer reference
- Recorded results must meet the batch limits before storage
- No automatic certification or guaranteed premium price

Access stays scoped to the farmer and assigned staff.

A small pilot. Clearly defined measures.

3–5

farmers · 1 cooperative · proposed 6–8 weeks

- Record completeness and missed checks
- Downgraded/rejected weight share
- Recorded selling price per kg
- Sales less logged post-harvest costs

Proposed pilot design, not confirmed participation or measured impact.

Be precise about readiness.

- Built locally: workflow, measurements, reviews and reports
- Verified: code tests and isolated browser scenarios
- Still needed: staging migrations and live deployment checks
- Still needed: trained reviewers, tools and a farmer pilot

No verified income uplift, adoption rate or quality-improvement claim yet.

25 sec

Observe. Compare. Reflect. Improve.

- Observe actual practice and barriers
- Compare records with agreed criteria
- Reflect with farmers, staff and buyers
- Improve the workflow and test the next batch

Research Learning framing; no additional institutional rubric was supplied.

Help us test the workflow where the work happens.

- A cooperative and 3–5 farmer participants
- A qualified reviewer and buyer-agreed criteria
- Access to basic measurement tools and facilities
- A baseline review and regular learning sessions

CaAPs turns a process into records people can review together.

Sources, assumptions and evidence

- Industry challenge poster supplied by the user: Zamboanga del Norte cacao sector; 30–40% statement requires local validation.
- ICCO: Harvesting & Post-harvest
- DOST-PCAARRD: Cacao Industry Profile
- TESDA: Cacao Bean Grading Level II
- Local software tests use fixtures. Pilot scope and timing are proposals.
